### Known Issues in Version 2026.2 Update 1

#### **AWS RDS task may fail in some cases**

##### **Applies to:**

Raynet One Data Hub 2026.2 Update 1

##### **Description:**

In some cases when using using Access Key & Secret “No RegionEndpoint or ServiceURL configured” or when using OIDC auth method “No role arn specified” or “An invalid request URI was provided. Either the request URI must be an absolute URI or BaseAddress must be set.” errors can be raised.

##### **Workaround:**

Setting the environment variable `AWS_REGION` to the aws region to be used (i.e. eu-central-1) will solve the issue. The variable should be accessible by the user running the agent.
