

Floating License Server 8.0

8.0.2856.2238 [Update 1]

Released on Apr 30, 2026

Improvements

Refreshed web interface RPACK-205

The administration page has a modern new look with cleaner layout, an optional dark mode, and live usage charts that let you see current and historical license consumption at a glance (both the last 24 hours and the last 30 days).

Manage licenses and machines from the browser RPACK-203

Administrators can now release an active floating license and block or unblock individual machines directly from the web page. No server access or command-line tools required.

Optional password protection RPACK-206

The web interface can be secured with an administrator password. When set, access requires sign-in; when left empty, the server behaves as before, so existing installations continue to work without any change. Connections are now served over HTTPS using a certificate the server manages for you, or a certificate you provide.

Resolved issues

- Fixed an issue where upgrading the Floating License Server through the MSI installer could corrupt the configured port number, leaving the service unreachable after the upgrade.
